Computer Systems An Integrated Approach
In the early days of computing, hardware and software systems were designed separately. Today, as multicore systems predominate, this separation is becoming impractical. Computer Systems examines the key elements of all computer systems using an integrated approach that treats hardware and software as part of the same, larger system. Students gain important insights into the interplay between hardware and software and leave the course with a better understanding of a modern computer system

Computer-integrated manufacturing (CIM) is the manufacturing approach of using computers to control entire production process. [1] [2] This integration allows individual processes to exchange information with each part.

Computer-integrated manufacturing - Wikipedia
This work presents an integrated approach for the design and evaluation of distributed energy resources (DER) systems, based on a detailed Mixed Integer Linear Programming (MILP) model. The mathematical model takes into account energy requirements of the site, local climate data, utility tariff structure, characteristics of the candidate DER technologies (technical and financial) as well as geographical aspects.
