Using mixed and augmented reality in communities is an emerging media practice that is reshaping how we interact with our cities and neighbors. From the politics of city hall to crosswalks and playgrounds, mixed and augmented reality will offer a diverse range of new ways to interact with our communities. In 2016, apps for augmented reality politics began to appear in app stores. Similarly, the blockbuster success of Pokémon Go illustrated how even forgotten street corners can become a magical space for play. In 2019, a court case in Milwaukee, Wisconsin, extended first amendment rights to augmented reality. For all the good that these emerging media provide, there will and have been consequences. Augmented and Mixed Reality for Communities will help students and practitioners navigate the ethical design and development of these kinds of experiences to transform their cities. As one of the first books of its kind, each chapter in the book prepares readers to contribute to the Augmented City. By providing insight into how these emerging media work, the book seeks to democratize the augmented and mixed reality space. Authors within this volume represent some of the leading scholars and practitioners working in the augmented and mixed reality space for civic media, cultural heritage, civic games, ethical design, and social justice.

An investigation of independent video games—creative, personal, strange, and experimental—and their claims to handcrafted authenticity in a purely digital medium. Video games are often dismissed as mere entertainment products created by faceless corporations. The last twenty years, however, have seen the rise of independent, or “indie,” video games: a wave of small, cheaply developed, experimental, and personal video games that react against mainstream video game development and culture. In *Handmade Pixels*, Jesper Juul examine the paradoxical claims of developers, players, and festivals that portray independent games as unique and hand-crafted objects in a globally distributed digital medium. Juul explains that independent video games are presented not as mass market products, but as cultural works created by people, and are promoted as authentic alternatives to mainstream games. Writing as a game player, scholar, developer, and educator, Juul tells the story of how independent games—creative, personal, strange, and experimental—became a historical movement that borrowed the term “independent” from film and music while finding its

own kind of independence. Juul describes how the visual style of independent games signals their authenticity—often by referring to older video games or analog visual styles. He shows how developers use strategies for creating games with financial, aesthetic, and cultural independence; discusses the aesthetic innovations of “walking simulator” games; and explains the controversies over what is and what isn't a game. Juul offers examples from independent games ranging from *Dys4ia* to *Firewatch*; the text is richly illustrated with many color images.

Clinical Psychometrics can be defined as a discipline that deals with the definition and measurement of clinical constructs. Among its interests, it includes dimensions, such as skills, behavior, psychopathology, quality of life, and personality. Indeed, this discipline focuses on individual differences, the theory of measurement, the construction of measure instruments and their application in an international context. Clinical Psychometrics can be considered as an essential tool in many fields of research related to psychological and psychiatric interventions: for example, it is useful for diagnostic assessment (in various fields, including clinical and forensic areas), for the design and evaluation of specific psychological and pharmacological treatments. Therefore, Clinical

Psychometrics is an applied discipline using psychometric tools to develop evidence-based type procedures relating to the understanding and improvement of the psychological conditions of individuals. This Research Topic on “Clinical Psychometrics” is interested in several aspects of measurement of psychological variables, focusing on the two fundamental paradigmatic aspects of the discipline, the Classical Test Theory and the Item Response Theory. This Research Topic seeks to stimulate a scientific debate between psychotherapists and psychometricians in this area. It could have applicative fallouts, such as designing trans-cultural studies in order to: 1) investigate the invariance of new instruments for measuring clinical variables; 2) test the invariance of existing instruments used in clinical research; 3) develop more refined measure instruments for the evaluation of clinical dimensions, similarly to work conducted by the Obsessive Compulsive Cognitions Working Group in identifying domains considered central to OCD and developing the 87-item Obsessive Beliefs Questionnaire; 4) evaluate therapeutic outcomes and processes (such as, states stress, psychological distress, psychological adjustment to illness, health-related quality of life, mood disorders, sexual functioning, etc.). The goal of this Research Topic is to disseminate a culture of integration between “psychometric model” and “clinical model”, promoting the scientific debate about the deepening of the

existing methods and/or the proposal of new methods capable of combining clinical significance with quantitative rigor. This Research Topic welcomed all types of articles, with the exception of case reports. We were particularly interested in: 1. Systematic reviews shedding new lights on the psychometric properties of the most used psychological measures in clinical psychology, neuroscience, psychiatry, psychosomatics, etc.; 2. Guidelines and suggestions on the correct use and gold standards in psychological assessment in the form of research studies and brief reports on the development of new measures and adaptation of existing ones.
